from the foreword the chief aim of this book is to present the reader with an integrated system of methods dealing with

geographical statistics geostatistics and their applications it sums up developments based on the vast experience accumulated by professor bachi over several decades of research interest in the quantitative locational aspects of geography and in the common ground of geography and statistics has grown rapidly involving an ever increasing spectrum of scientific disciplines the present volume will fill a genuine need as a textbook as a reference work and as a practical aid for geographers applied statisticians demographers ecologists regional planners economists professional staff of official statistical agencies and others e peritz g nathan n kadmon

a novel practical approach to modeling spatial uncertainty this book deals with statistical models used to describe natural variables distributed in space or in time and space it takes a practical unified approach to geostatistics integrating statistical data with physical equations and geological concepts while stressing the importance of an objective description based on empirical evidence this unique approach facilitates realistic modeling that accounts for the complexity of natural phenomena and helps solve economic and development problems in mining oil exploration environmental engineering and other real world situations involving spatial uncertainty up to date comprehensive and well written geostatistics modeling spatial uncertainty explains both theory and applications covers many useful topics and offers a wealth of new insights for nonstatisticians and seasoned professionals alike this volume reviews the most up to date geostatistical methods and the types of problems they address emphasizes the statistical methodologies employed in spatial estimation presents simulation techniques and digital models of uncertainty features more than 150 figures and many concrete examples throughout the text includes extensive footnoting as well as a thorough bibliography geostatistics modeling spatial uncertainty is the only geostatistical book to address a broad audience in both industry and academia an invaluable resource for geostatisticians physicists mining engineers and earth science professionals such as petroleum geologists geophysicists and hydrogeologists it is also an excellent supplementary text for graduate level courses in related subjects

solved problems in geostatistics brings together exercises and projects that demonstrate key principles and build strong bridges between theory and practice each chapter focuses on a comprehensive topic with examples and problems for a technologically evolving audience problems in each chapter are classified as analytical numerical or practical exercises are identified as foundational advanced or esoteric objectives highlight important learning concepts this hands on practical guide offers a supplement to any college level

land reclamation particularly of land disturbed by mining is a major environmental issue throughout the world thirty eight chapters explore the vast complexities involved in reclamation after large scale disturbances and provide a broad range of perspectives and examples of reclamation efforts readers will find specifics from mapping minesoil to policy making from

geochemistry to large scale topography from the papermill to oil shale and emerge with an overall understanding of reclamation strategies and challenges

this book contains selected contributions from the geoenv96 first european conference on geostatistics for environmental applications held in lisbon in november 1996 this is the first of a geoenv series of biennial planned books the series is intended to show the state of the art of geostatistics in environmental applications with new cases results and relevant discussions from leading researchers and practitioners around the world new and important theoretical and practical developments of geostatistics in the environmental field were compiled from three main areas hydrology groundwater and groundwater contamination soil contamination and site remediation air pollution ecology and other applications the book presents a set of geostatistical tools and approaches used to successfully resolve a variety of specific problems in environment modelling especially those resulting from the typical scarcity of spatial sampling the time component of very dynamic systems the modelling of various systems of contaminants the uncertainty assessment of health cost functions etc prominent topics concerning methodological tools and methods stochastic simulation techniques models of integrating soft information seismic and remote sensing images inverse modelling of groundwater flow neural network classification change of support and up scaling are also included in this book this publication will be of great interest and practical value to geostatisticians working both in universities and in industry
